

JAP – Web-Mixes

Stefan Köpsell, TU Dresden, sk13@inf.tu-dresden.de

- ⌘ Overview
- ⌘ Statistics
- ⌘ Mix Development and Deployment
- ⌘ How to attract Developers ?
- ⌘ Attracting Users
- ⌘ Abuse
- ⌘ Results of a users' Survey

Overview

- ⌘ open for public use since autumn 2000
- ⌘ 1,3 Mio visits of our Web-Page <http://anon.inf.tu-dresden.de>
- ⌘ > 200,000 downloads of JAP:
 - ⊠ Windows : ca. 75 %
 - ⊠ MacOS : ca. 3 %
 - ⊠ Other : ca. 22 % [Linux, OS/2, Irix, Solaris etc.]
- ⌘ 1,500–2,000 users concurrently online, maybe >30,000 in total
- ⌘ 100 GByte traffic per day / 3 TByte traffic per month
- ⌘ 10 Mio. URLs processed per day:
 - ⊠ HTTP: >99,9% of requests >90% of traffic
 - ⊠ FTP : < 0,1% of requests 5-10% of traffic
 - ⊠ Targets: ca. 50% “.com” ca. 25% “.de” ca. 10% “.net” ca. 2% “.org”

Compared to other anonymous communication systems:

Is this little or much ???

 - ⊠ Targets: ca. 50% ".com" ca. 25% ".de" ca. 10% ".net" ca. 2% ".org"

Compared to other anonymous communication systems :

Is this little or much ???

Mix Deployment

⌘ 1. Approach

⊠ Assumption:

- ⊕ Mix operators are experienced system (unix) administrators

⊠ Conclusion:

- ⊕ Mix software installation and configuration need not to be easy

⊠ Results:

- ⊕ 1. Mix software is a command line program with many options
- ⊕ 2. Mix software comes as source code

⇒ **The people who were willing to operate a mix failed.**

⌘ 2. Approach

⊠ Assumption:

- ⊕ NOT all Mix operators are experienced system administrators

⊠ Conclusion

- ⊕ Mix installation and configuration has to be as easy as possible

Mix Deployment

☒ Results:

- ⊕ Graphical user interface for Mix configuration written in Java (executable either as application or applet within your favourite browser)
- ⊕ Mix software is still a command line tool, but has only one option: the configuration file
- ⊕ Mix software runs on many platforms, so the operator can choose her or his favourite one
- ⊕ Try to use only components, which are included in the default installation of that operating system

☒ A new problem:

- ⊕ Configuration file is XML ⇒ we use Apaches Xerces-C++ XML-Library
 - ⊕ Problems:
 - C++ ABI changed with every Version of GNU GCC, so precompiled versions of Xerces-C++ are often not usable
 - Changes in the Xerces-API (including namespace etc.) make it difficult to hold the Mix software compatible with all versions of Xerces
- ⇒ If people fail to compile the Mix the reason is Xerces!
- ⇒ Potential solution: Use other XML-Library like libxml, which is written in C
... but this makes development more difficult

Easy development ∪ **Easy deployment ??**

Easy development ∪ **Easy deployment ??**

Mix-Configuration Tool

The screenshot shows the 'Mix Configuration Tool' window with a menu bar (File, Help) and four tabs: General, Network, Certificates, and Description. The 'Certificates' tab is active, displaying three sections for certificate management: 'Own Mix Certificate', 'Previous Mix Certificate', and 'Next Mix Certificate'. Each section includes an 'Import...' button and text input fields for Name, Valid From, and Valid To. The 'Own Mix Certificate' section also features buttons for 'Create a New One', 'Export...', and 'Change Password'.

Mix Configuration Tool

File Help

General Network Certificates Description

Own Mix Certificate

Create a New One Import... Export... Change Password

Name CN=<Mix id="141.76.1.120%3A6544"/>

Valid From Thu Oct 17 10:05:15 CEST 2002

Valid To Sun Nov 03 09:45:44 CET 2002

Previous Mix Certificate

Import...

Name

Valid From

Valid To

Next Mix Certificate

Import...

Name CN="<Mix id="192.168.0.3%3A6544"/>"

Valid From Tue Aug 06 17:07:22 CEST 2002

Valid To Fri Aug 23 17:47:51 CEST 2002

Mix Deployment

☒ Results:

- ⊕ Graphical user interface for Mix configuration written in Java (executable either as Application or Applet within your favourite browser)
- ⊕ Mix software is still a command line tool, but has only one option: the configuration file
- ⊕ Mix software runs on many platforms, so the operator can choose her or his favourite one
- ⊕ Try to use only components, which are included in the default installation of that operating system

☒ A new problem:

- ⊕ Configuration file is XML ⇒ we use Apaches Xerces-C++ XML-Library

⊕ Problems:

- C++ ABI changed with every Version of GNU GCC, so precompiled versions of Xerces-C++ are often not useable
 - Changes in the Xerces-API (including namespace etc.) make it difficult to hold the Mix-Software compatible with all versions of Xerces
- ⇒ If people fail to compile the Mix the reason is Xerces!
- ⇒ Potential solution: Use other XML-Library like libxml, which is written in C
... but this makes development more difficult

Easy development ∪ **Easy deployment ??**

How to Attract Developers ?

- ⌘ Coding the whole system (Mixes, JAP, InfoService etc.) needs really much resources (manpower)
- ⌘ Idea: Using the power of the open source community to help
 - ⊗ Whole project is open source (BSD style licence) and available at sourceforge.net
 - ⊗ But: Attracting developers is not that easy (maybe because of the special research character of the project ?)
 - ⊗ **How to attract developers ??**
 - ⊗ **How is the development of other anon systems organized ??**

Attracting Users

⌘ Support as many platforms as possible:

- ⊗ JAP is written in Java 1.1 and available for nearly every platform
- ⊗ Problems:
 - ⊕ Java grants no access to system specific functions and configuration, e.g. changing the browser settings to use JAP as proxy is not possible
 - ⊕ Real integration in the look and feel of a system is not possible
 - ⊕ "write once, run anywhere" does not really work
 - ⊕ **Solutions ??**

⌘ Installation and configuration have to be easy:

- ⊗ If the user is not able to get it run within 10 minutes he will not use it at all
- ⊗ Most users like a graphical interface not a command line tool

⌘ Give them support:

- ⊗ We have answered more than 5000 e-mails from users
 - ⊕ **Has anyone experiences with tools supporting this ??**
- ⊗ Users are not willing to read anything like documentation, FAQs etc.
 - ⊕ **How to force them reading before asking ??**

Attracting Users

⌘ Firewalls are always a problem:

- ⊗ in companies “normal” users have no influence on the firewall configuration
- ⊗ Home users have many different kinds of personal firewalls and often do not know how to change their configuration
- ⊗ Our solution:
 - ⊕ use only few connections to the outside world
 - ⊕ design them in a way, that they could be tunnelled via common proxy protocols like HTTP, SOCKS etc.
 - ⊕ let servers listen on usually “accessible” ports (80, 443 etc.)

Other solutions ??

⌘ We have made no “active” advertisement, but others report about the project on different media:

- ⊗ Newspapers, radio, TV, Internet etc.
- ⊗ Especially we get a push after each message on the German internet news board called “Heise News Ticker”
- ⊗ But: We believe, that at the moment most of our users are Germans, so

What are the relevant media (especially internet based) for other countries ?

⌘ We have exhibited on fairs like CeBIT

- ⊗ Although this also attracts users, using internet based media is much cheaper and results in more attention

⌘ “Hidden” functionality

- ⊠ People in countries with restrictive Internet access use the system just to freely browse the whole Web
- ⊠ Some countries have blocked our anon service
- ⊠ Big challenge:

How to make blocking as difficult as possible ?

⌘ Keeping the system “alive”

- ⊠ Development and operating of the system cause great running costs
- ⊠ At the moment covered by the research project
- ⊠ But: How to recoup the costs afterwards ?
- ⊠ Are the users willing to pay, how much ?

Which experiences did commercial systems make?

⌘ Misuse of our anon service:

- ⊗ credit card fraud
- ⊗ blaming of people in postings to Newsgroups or Internet forums
- ⊗ identity theft
- ⊗ hacking of servers which run unpatched Microsoft IIS
- ⊗ 2-3 request per month from the police or public prosecutors
- ⊗ on request of site operators, we block them
- ⊗ Which experience did other anon systems make?
- ⊗ Should there be the possibility to reveal identities in certain situations (maybe according to the fairness assumptions of digital cash (e-coins)) ?
- ⊗ How to achieve this without monitoring all users?
- ⊗ In the sense of fairness, should the requested server be informed, that a certain request is anonymized (maybe by including a X-Anonymized header line) ?
- ⊗ Could this solve some abuse problems ?

⌘ Abuse in Peer-To-Peer based systems:

- ⊗ in our system, only we get into contact with the police, but NOT our users (because the IP of the last node belongs to us)
- ⊗ this is different in Peer-To-Peer based systems like Crowds or Tarzan, because every participating user may be a "last node"
- ⊗ Is this a big problem for the acceptance of Peer-To-Peer based systems ?
- ⊗ Perhaps users would not risk to be contacted by the police ?

Results of a users' Survey

- ⌘ Web based users' survey
- ⌘ 4190 Entries from 07/04/2001 – 03/22/2003
- ⌘ Results: (multiple choices are possible)
 - ⊗ Reasons for using JAP:
 - ⊕ 64% protection against the ISP
 - ⊕ 51% protection against the police, secret service etc.
 - ⊕ 47% protection against the operators of the Anon-Service
 - ⊕ 34% free speech
 - ⊕ 44% easy to use
 - ⊕ 12% bypass censorship
 - ⊗ 55% of the Users are willing to pay for JAP
 - ⊗ 7% of the Users use JAP relating to business

Has anyone else made a survey relating to anonymous communication systems – and what are the results ??
