Context

Our Approach

Background

Pan-private BLIP and Cardinality Set Operations

Experimental Results

Conclusion

Wi-Fi devices as personal beacons

- ▶ Wi-Fi enabled devices broadcast a **unique** ID: the **MAC** address
 - ▶ Connected: in Data, Management and Control Frames
 - ▶ Disconnected: in probe-requests (Management) Frames

Physical Analytics

- ▶ **Objective:** Measure and analyse human activity through Wi-Fi
 - ▶ One MAC address = One person
- ▶ **Examples of analytics tasks:**
 - ▶ Number of visitors
 - ▶ Duration/frequency of visits
 - ▶ Most popular paths between different locations
 - ▶ ...

source : Libelium

Current industrial practices for protecting privacy are not good enough

- ▶ Most of the companies rely on hashing to prevent the re-identification of the MAC address
- ▶ Hashes can be reversed in minutes using brute-force attack [DCL'14]

Time	Location	MAC
12:09	A-4	00:11:11:11:11:11
12:12	B-4	00:11:11:11:11:11
12:13	E-5	00:22:22:22:22:22
12:13	F-4	00:33:33:33:33:33
12:14	B-4	00:11:11:11:11:11

Time	Location	Hash (md5)
12:09	A-4	fb2d5084c0ad1fdf6c29fe2aa323b758
12:12	B-4	fb2d5084c0ad1fdf6c29fe2aa323b758
12:13	E-5	69dc015b56448651561e1a4301ac9b4d
12:13	F-4	07024831442e8b86a06e905fd4d391ce
12:14	B-4	fb2d5084c0ad1fdf6c29fe2aa323b758

Context

Our Approach

Background

Pan-private BLIP and Cardinality Set Operations

Experimental Results

Conclusion

Threat model (Pan-Privacy [DNPRY'10])

- ▶ Attacker: **internal actor** (data collector) or **external intruder**
- ▶ Resource to protect: **internal state** of the system *and* the final output
- ▶ Protection must be done *on-the-fly*, as each MAC address is observed

C. Dwork, M. Naor, T. Pitassi, G. N. Rothblum, and S. Yekhanin. **Pan-Private Streaming Algorithms**. ICS'10

Pan-Privacy

Pan Privacy (informal and simplified) [DNPRY'10]

An algorithm is ϵ -differentially pan-private if the distribution of **both**:

- ▶ The internal state of the algorithm
- ▶ The final output

does not differ too much (depending on ϵ) if one MAC address was added

- ▶ Intention: from the internal state of the system and the output, the adversary cannot distinguish whether or not the MAC address of the user is present in the encoded set

Pan-Private Streaming Algorithms. ICS'10

Approach

Observation

Many mobility analytics can be based upon a primitive:

Cardinality Set Operations

(Also known as **Count-Distinct Queries**)

between different locations at different times

Example (Mobility Analytics)

	Temporal	Spatial	Set Operation
Number of visitors			Cardinality
Number of visitors		✓	Union
Amount of time they spend	✓		Intersection
Frequency of their visits	✓		Intersection
Their movement trajectories	✓	✓	Intersection
Most frequently taken path	✓	✓	Intersection

Our Approach

- ▶ **Key idea:** design a privacy-preserving data structure for computing the **Cardinality Set Operations** while protecting the **privacy** of individual users
- ▶ Agnostic to data source (**not limited to Wi-Fi**)
 - ▶ Cellular-based mobility analytics (Call-Detail-Records) ¹
 - ▶ Web analytics
 - ▶ Any system with unique identifiers. . .
- ▶ **Designed data structure:** based on **Bloom filters** that are perturbed to ensure **differential privacy** and built on the fly to ensure **pan-privacy**.
- ▶ **Non-interactive:** create the data structures first, specify the mobility analytics to compute later
- ▶ **Decentralized:** No need to coordinate between sensors

Context

Our Approach

Background

Pan-private BLIP and Cardinality Set Operations

Experimental Results

Conclusion

Bloom Filters [Bloom 1970]

- ▶ Sets can be represented as Bloom filters

- ▶ Two operations: **insert** and **contains**
- ▶ Highly efficient in space and time
- ▶ Small probability of false positives, no false negatives
- ▶ Can add but cannot remove elements
- ▶ Not private: can be exhaustively queried

BLIP [AGK 12]

- ▶ Bloom Filter with **Differential Privacy** guarantees
- ▶ BLIP = BLoom-then-flIP
 - ▶ **Step 1**: Represent a set of identifiers as a Bloom filter
 - ▶ **Step 2**: flip each bit independently and identically at random with probability $p < 0.5$.

- ▶ Estimator for distinct number of stored identifiers [BFG'14]

[BFG'14] Balu R., Furon T., Gambs S., **Challenging differential privacy: the case of non-interactive mechanisms**. In ESORICS 2014

Context

Our Approach

Background

Pan-private BLIP and Cardinality Set Operations

Experimental Results

Conclusion

Pan-Private BLIPs

- ▶ Choose two Bernoulli distributions, $D_0 \neq D_1$, according to ε

Pan-Private BLIP: Initialize

- ▶ Initialize all bits randomly from D_0

Pan-Private BLIP: Add element x

- ▶ Set bits $h_1(x), h_2(x), \dots, h_k(x)$ randomly from D_1

Distinct-Count Queries for n BLIPs

Example (1/2) : Plain (unflipped) Bloom filters

- ▶ Given two **unflipped** Bloom filters of size m
- ▶ Add them component-wise (over the integers)
- ▶ Tally the components
- ▶ Intersection ≈ 4 (number of components of count 2)
- ▶ Union ≈ 9 (number of components of count ≥ 1)

Distinct-Count Queries for n BLIPs

Example (2/2) : Pan-Private BLILPs

- ▶ Given two **flipped** Bloom filters of size m
- ▶ Add them component-wise (over the integers)
- ▶ Tally the components
- ▶ Estimate the unflipped tally [ACM 17]

Distinct-Count Queries for n BLIPs

The general case: Symmetric Counts (t-out-n counts)

Number of elements belonging to **exactly** t sets out of n

- Can estimate any count from several symmetric counts

Context

Our Approach

Background

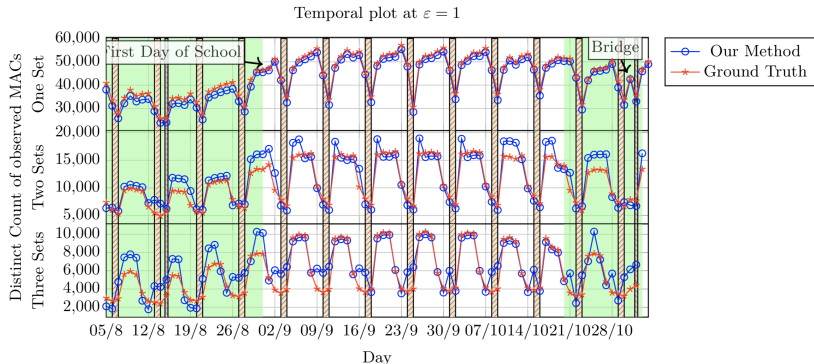

Pan-private BLIP and Cardinality Set Operations

Experimental Results

Conclusion

Temporal Patterns

- ▶ Wi-Fi Dataset provided by CISCO of a large European city
- ▶ 1.4 million devices, 91 days
- ▶ Evaluation using BLIPs, 1 BLIP per day

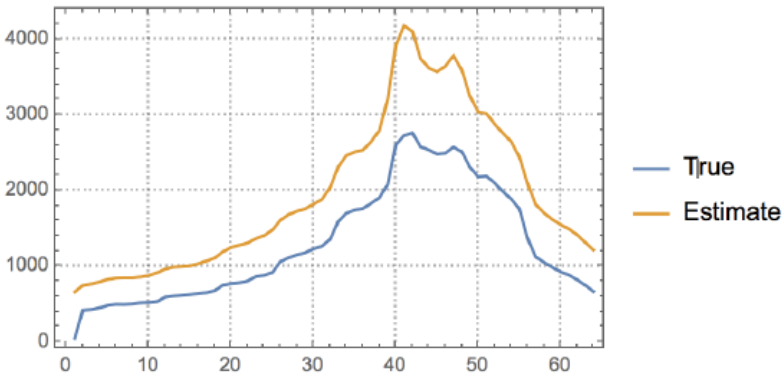

Spatial Patterns

- ▶ Top-10 origin-destination pair
- ▶ F1 score is 1 when two sets are identical and 0 if they share no elements at all

Temporal patterns (World cup dataset)

- ▶ HTTP request dataset for the FIFA World Cup 1998 website.
- ▶ 2.8 million unique IPs, 88 days.
- ▶ Evaluation using BLIPs, 1 BLIP per day ($\epsilon = 3$; $m = 2^{18}$)
- ▶ Estimating the **intersection of a rolling window of 30 days**

Managing the privacy budget

- ▶ **Fundamental issue of a privacy budget:** the more a user appears in several BLIPs, the more his privacy budget is impacted \Rightarrow increase of risk of re-identification for a user.
- ▶ In practice, more than 90% of users do not appear in more than 6 BLIPs in the CISCO dataset
- ▶ **How to mitigate the impact:**
 - ▶ Could change spatial or temporal granularity (make it more coarse)
 - ▶ Regular change of hash functions (prevent inferences between BLIPs based on different hash functions)
 - not a silver bullet

Context

Our Approach

Background

Pan-private BLIP and Cardinality Set Operations

Experimental Results

Conclusion

Conclusion and Future Work

- ▶ Privacy-friendly wifi analytics: accurate patterns + privacy of individuals
- ▶ Pan-privacy: Privacy is preserved even if attacker gains full access to stored data
- ▶ BLIPs: Versatile building block for set operations
- ▶ We provide error bounds which can be of independent interest for **analysis of hashing collisions**
- ▶ Promising experimental evaluations
- ▶ Challenge: parameter tuning trade-off (ϵ , Bloom filter size)
 - ▶ Cardinalities are not known in advance
- ▶ Future work: Designing practical inference attacks
- ▶ Future work: More complex physical analysis tasks, e.g. traffic forecast, anomaly detection, point-to-point travel time, or urban network characterization

Thank You!
